

## ProTools App: ECO Tec Series 2 Software Update

Regular inspections and maintenance by a qualified heating professional are essential to keep a modern high efficiency condensing boiler operating at peak efficiency over its useful life. It's good practice to be prepared for annual maintenance calls, emergency situations, and perform preventative actions that can potentially avoid future incidents.

Weil-McLain already offers kits to optimize customer service for maintenance and emergency incidents, and now we have a new preventative action item that can be used during annual maintenance or emergency service calls when addressing an ECO Tec Series 2 residential gas boiler. Our Weil-McLain ProTools Tech app has a connectivity feature that provides registered contractors the ability to download the latest control firmware (software), and wirelessly transfer it on to the boiler via a smart phone Bluetooth connection.

Our firmware designers are constantly looking for ways to add abilities and refine existing operation that provides peak performance and enhances user experience. Make it part of your routine to check for, and use, the latest firmware version when servicing ECO Tec Series 2 boilers.

Click on the link to see the simple steps to update the firmware.
